January 27, 2020

To whom it may concern:

We are both physicians with board certifications in obstetrics and gynecology and addiction medicine.¹ The case of Ms. Becker has come to our attention,² and we are gravely concerned that medical misinformation may be the reason she is currently in jail, including the unsupported assumption that substance use disorders should be treated as dangerous criminal activities and/or the unfounded supposition that methamphetamine use causes stillbirths. As we explained in *The Effects of Cocaine and Amphetamine Use During Pregnancy on the Newborn: Myth versus Reality*, the “assumption that women who use drugs are impaired in their ability to mother displays a complex and deep bias in our society.”

Ms. Becker’s arrest also seems to assume that pregnant women can guarantee healthy birth outcomes and therefore may be held criminally responsible if they do not. That is simply not true. Increasingly, research shows that pregnancy outcomes have far more to do with economic, social and environmental conditions experienced in the course of one’s life, rather than anything one does or does not do while pregnant.³

*Substance use disorders are medical conditions, not dangerous crimes.*

---

Most people stop using drugs when they become pregnant, but some can’t. And people who can’t stop using a drug during pregnancy, most likely have an addiction – a statement that is supported by position papers from both the American Society of Addiction Medicine and the American Congress of Obstetrician Gynecologists.4 Medical experts have long recognized that “addiction is a chronic illness” not a “moral weakness” and it is best addressed through healthcare not incarceration.5 Pregnant women with substance use disorders care about the health of their pregnancies, as do women with other chronic health conditions such as epilepsy, diabetes, hypertension, asthma, etc. The supposition that women with addiction are willfully harming their fetuses and don’t care about their children is absurd and in complete conflict with established medical science. The hypothesis that threat of arrest positively influences maternal behavior and improves birth outcomes is contradicted by decades of empirical evidence.

Professional medical society recommendations are universal in their support of treatment for individuals with addiction and in their opposition to incarceration.6 Published data confirm that criminal prosecution has not reduced the rate of substance use or misuse in the United States.7 Nor does the risk of prosecution serve to dissuade people, including pregnant women, from using

---

Punitive policies at the state level related to substance use during pregnancy are not associated with any reduction in use (or improvement in birth outcomes) at the population level.

**Methamphetamine use and pregnancy**

There is a commonly held misconception that any amount of substance use, including methamphetamine, is uniquely and fatally dangerous to a pregnant woman and her baby. That is simply not true. As we have explained in *The Effects of Cocaine and Amphetamine Use During Pregnancy on the Newborn: Myth versus Reality*, “Although much remains unknown about the effects of in utero methamphetamine exposure, no consistent teratological effects on the developing human fetus have been identified.”

**Stillbirths impact tens of thousands of women each year**

Pregnancy loss in the United States is common and the causes often unknown. At least 20 percent of all pregnancies end in miscarriages and stillbirths, whether or not a person smokes cigarettes, drinks alcohol, or uses criminalized substances. Yet this prosecution suggests that any

apparent stillbirth may be considered a crime and investigated in California as such. This would require a dramatic expansion of the role of police and prosecutors in pregnancy and birth outcomes. It would result in intrusions into a family’s grief through interrogation of those who have experienced a pregnancy loss as well as potential privacy violations through the examination and dissemination of pregnant and post-partum women’s medical records.

Public Health Impact

As physicians, we agree with every major medical and public health association, including the American Medical Association and the National Perinatal Association, that substance use is a health issue best addressed through health care, and that a criminal justice approach has negative consequences.\textsuperscript{15} Criminalizing and incarcerating women related to substance use completely inverts the principles of public health and medical practice and can be of dire consequence to maternal and fetal health, as fear of criminal prosecution deters people from obtaining prenatal and other health care.\textsuperscript{16}

Therefore, we write to support Ms. Becker’s request.

Sincerely,

\ -- \\
